

2. If your application has holes in the firewall for heater hoses, that are unused, use them. If you need to drill your own holes for the heater hoses, be sure to install grommets to keep the hose from being cut on the edge of the sheet metal.

3. Flex-a-lite recommends connecting the fan power to a key hot power source. The best place to do this is at the fuse block. Use a test lamp or meter to find a power source that is hot with the key on only. Be sure to install the provided 15-amp fuse.

4. We varied from the Flex-a-lite instructions by installing the fuse close to the battery and using a previously installed relay under the dash to control the circuit from the key.

5. The control switch for the Mojave Heater is a simple rotary piece. Turning the knob will take the heater from off to low, medium or high-speed operation. We reused the factory Cigarette lighter bracket to mount our switch under the dash.

## THE NEW BESTOP HARDTOP BLOWS THE LID OFF OTHER HARDTOPS!

➤ Introducing the Bestop® Hardtop, a new fiberglass-reinforced design that lets you store the cockpit cover on top of the optional roof rack—instead of in your back seat.

And look at this host of other unique features: molded-in gel-coat that provides fade-resistant color; a rear window with defroster that locks without a key; rear pillar vents that help keep the side windows frost-free; overhead mesh pockets; a dome light; and grooves on the cockpit cover to channel water away from the door openings.

Available with or without upper doors with dual sliding windows, the Bestop Hardtop is really a hard top—to pass up. One-piece model available soon.
